

Sugar, Sugar — Player Guide

Overview

Sugar, Sugar is a physics puzzle game: sugar falls from a tap, and your goal is to guide it into one or more cups by drawing walls with the mouse. Each level introduces a different challenge — inverted gravity, teleporters, portals that change the sugar's color, cups requiring several colors at once...

Launching the game

Double-click SupSugar.exe. No Python or library installation is required, everything is bundled.

Main menu

Two buttons on opening:

- **Play:** opens the level selection screen.
- **Settings:** opens the settings screen.

Level selection

Each level is represented by a button showing its name. A greyed-out level with a padlock isn't unlocked yet — finish the previous level to open it. A completed level stays accessible: you can replay it as many times as you like.

The **back** button (arrow, top left) returns to the main menu.

Settings

- **Music:** the left/right arrows switch tracks; the dedicated button mutes or resumes the music.
- **Resolution:** the arrows cycle through several predefined resolutions, then fullscreen mode.

Playing a level

The goal

Fill every cup in the level with the required amount of sugar, in the right color. The number of grains still needed is shown below each cup, in the relevant color. The level is won as soon as every cup is full.

Drawing walls

Click and hold the left mouse button, then move the cursor to draw a wall. Release to stop the stroke; a new click starts a new one. **Walls cannot be erased** once drawn — think before you draw, or use the reset button if you made a mistake.

Tip: a steep wall moves sugar along faster than a nearly flat one, which tends to make it pile up instead.

Level elements

- **Floor / ceiling:** block the sugar, which stops and accumulates there.
- **Side borders (left/right):** sugar that exits through them is permanently lost.
- **Hole in the floor or ceiling:** sugar that falls through it reappears on the opposite side of the screen, as long as the matching cell there is free.
- **Portal (colored square):** passable from both sides, it changes the color of any sugar passing through it.
- **Cup:** only accepts sugar through its top opening; every other side is solid. Some cups accept multiple colors at once, each with its own quota.

In-game buttons

- **Back** (top left): exits the level and returns to the selection screen.
- **Gravity arrow** (top right): flips the direction of gravity — sugar that already settled starts moving again if its new situation allows it.
- **Reset** (below the gravity arrow): restarts the level from scratch, drawn walls cleared, sugar reset to zero.

Progress

Completing a level automatically unlocks the next one. Progress is saved on your machine (cache/save.json, next to the executable) and is not lost when you close the game.
